DIGIVOTE®III
Config Tool

Description

DIGIVOTE®III Config Tool is part of the DIGIVOTE®III interactive professional software suite as well as DIGIVOTE®III basic interactive Add-in for MS-PowerPoint*. The tool runs also as a standalone Windows* application.

It enables the easy creation of listfiles so that the main DIGIVOTE® program software can recognise all available model VD30 voting units (also known as "keypads") and TR30 transponders. This procedure need only be carried out once, whenever new or different voting units are used.

The tool also provides a simple test of the designated voting units.

Furthermore, this tool serves the comfortable changing of the communication channel for transponder and voting units. This is necessary, for example, to start two separate voting sessions in close proximity. At last this tool manages the multi transponder mode, if more than one transponder is to be used.

Features

- BASIC and EXPERT mode
- Handheld lists administration; Next to a master list several other lists can be managed
- Collection of voting units by scanning mode
- Management for multi-transponder operation
- Extensive testing capabilities of handhelds
- Import of lists
- Merging of existing lists
- Changing of communication channel for transponder and handhelds
